Salo

PROBLEM:

When children are placed in a kindergarten, they typically start to get sick more often because there are so many children on the same premises every day. Epidemics tend to spread more easily in such an environment, even when the staff is careful with hygiene.

SOLUTION:

Blue WiSDOM AiR photon disinfection lights were installed in the toilets, and surfaces were treated with catalytic coating. The blue light is controlled by sensors to ensure that all surfaces are disinfected automatically when the WC is not in use.

BENEFITS:

“The disinfection system was installed three weeks ago when the stomach flu period was at its worst. The effect was astonishing—the number of children with the flu remained extremely low. In our other unit, which has no disinfection system, the flu infected more than half of the children. It will be interesting to see if the system also decreases sickness in children in the long term.”

– Päivi Isopuro, Director of Kindergarten
